The sync_child_accounts Script

Version: 94

Valid for versions 94 through the latest version

Last modified: December 15, 2020

Overview

The `/usr/local/cpanel/scripts/sync_child_accounts` script lets you synchronize the user configuration of a [distributed cPanel account](#). You can use this script when a cPanel account's user configuration falls out of sync between the [parent node](#) and its [child nodes](#). In most cases, you should not need to run this script. However, running this script for a synchronized account will **not** make any unwanted changes to a cPanel account.

Run the script

To run this script on the command line, use the following format:

```
/usr/local/cpanel/scripts/sync_child_accounts [options]
```

Options

Use the following options with this script:

Options	Description	Example
<code>--user</code>	Run the script for a distributed cPanel account.	<code>--user=username</code>
<code>--all</code>	Run the script for all distributed cPanel accounts. Note: You cannot pass both this option and the <code>user</code> option.	<code>--all</code>
<code>--help</code>	Print the script's help information.	<code>--help</code>
